Lab 2: Agile Backlog Creation & Sprint Simulation in Jira

Project: Campus Carpool — Fare-sharing ride matching platform
Student: Kanishq Surendran (PES2UG24CS214)
Section: D
Jira Project Key: CC | Board: CC board

Scenario

Campus Carpool lets a student who has already booked a ride (Ride Initiator) post the route and timing so nearby students going the same way (Co-riders) can join and split the fare. The app supports posting/searching rides, join requests with approval, and in-app coordination.

Epics

Epic 1: Ride Posting & Matching — Enables ride initiators to post rides and co-riders to search for matching rides.

Epic 2: Ride Booking & Communication — Enables co-riders to request to join rides and coordinate with the initiator.

User Stories

1. Post a Ride (Epic: Ride Posting & Matching | Priority: High | Story Points: 5)

As a ride initiator, I want to post my booked ride's route and timing, so that others going the same way can join and split the fare.

2. Search Rides (Epic: Ride Posting & Matching | Priority: Medium | Story Points: 3)

As a co-rider, I want to search for ongoing rides along my route, so that I can find one to join.

3. Edit/Cancel Ride (Epic: Ride Posting & Matching | Priority: Low | Story Points: 2)

As a ride initiator, I want to edit or cancel my posted ride, so that co-riders have accurate info.

4. Request to Join Ride (Epic: Ride Booking & Communication | Priority: High | Story Points: 3)

As a co-rider, I want to request to join a ride, so that I can confirm my seat and share the fare.

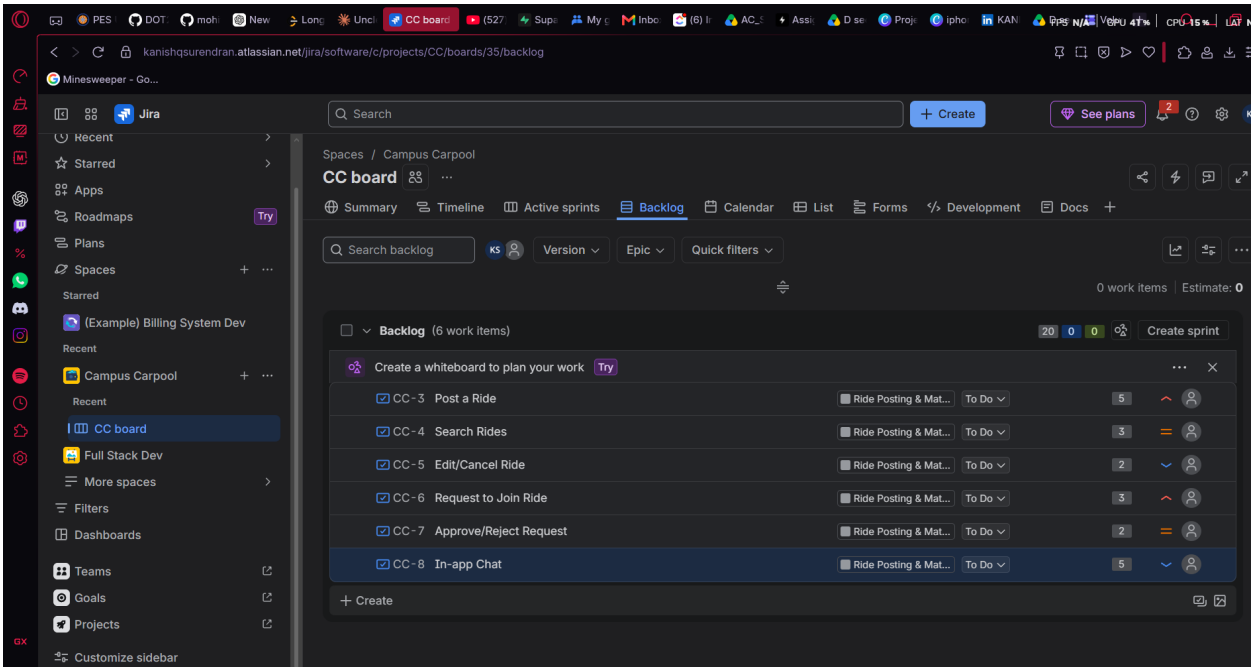

5. Approve/Reject Request (Epic: Ride Booking & Communication | Priority: Medium | Story Points: 2)

As a ride initiator, I want to approve or reject join requests, so that I control who shares my ride.

6. In-app Chat (Epic: Ride Booking & Communication | Priority: Low | Story Points: 5)

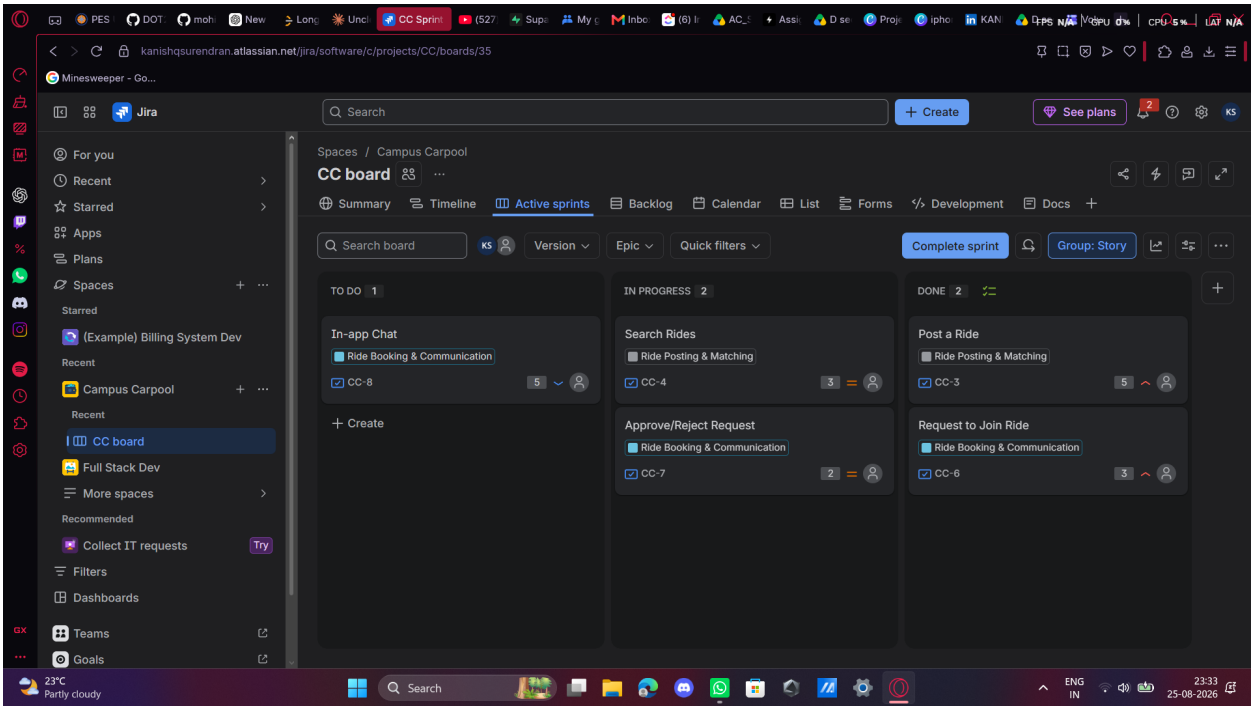

As a co-rider, I want to message the ride initiator, so that we can coordinate the pickup point.

Deliverable 1: Backlog — Epics, User Stories, Priority & Story Points

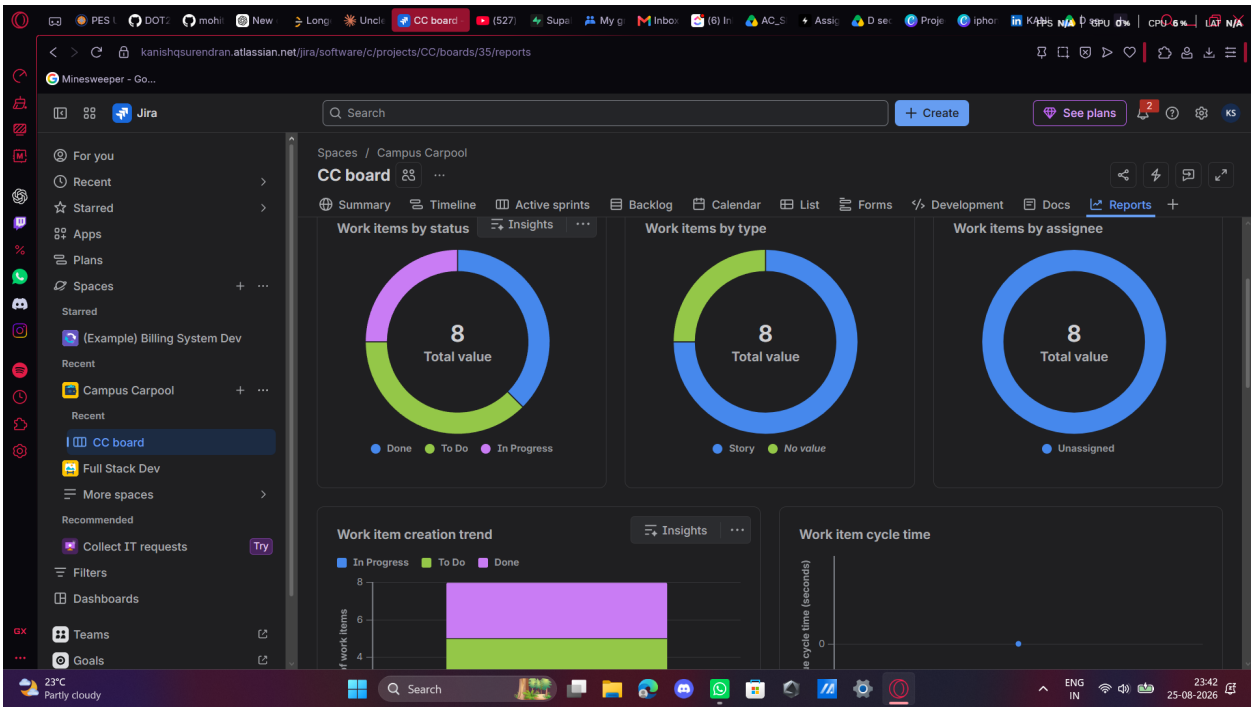

Deliverable 2: Active Sprint Board (Sprint 2 in progress)

To Do → In Progress → Done, simulating task completion across the sprint.

Deliverable 3: Sprint Progress Report — Work Items by Status

Jira's status-distribution report showing the split of completed, in-progress, and pending work items across both completed sprints (8 total: 6 stories + 2 epics).

Reflection Questions

1. Did your estimations reflect the actual effort?

Mostly. Story points were assigned using the Fibonacci scale based on perceived complexity — simpler CRUD-like stories (Edit/Cancel Ride, Approve/Reject Request) were scored lower (2), while stories involving more logic or UI (Post a Ride, In-app Chat) were scored higher (5). Actual effort would need real development time to confirm, but the relative ordering felt reasonable.

2. Was your backlog well-prioritized?

Yes, core flow stories (Post a Ride, Request to Join Ride) were marked High priority since the app is unusable without them. Supporting features (Search Rides, Approve/Reject Request) were Medium, and convenience features (Edit/Cancel Ride, In-app Chat) were Low, since the app is functional without them initially.

3. How did your simulated sprint align with your plan?

Sprint 1 covered the Ride Posting & Matching epic and completed 2 of 3 stories. Sprint 2 picked up the remaining story plus the entire Ride Booking & Communication epic. Splitting by epic kept each sprint focused on one functional area, which made planning and tracking progress easier.

4. What insights did the burndown/status report give about your team's capacity?

The status distribution shows a healthy mix of Done, In Progress, and To Do items across both sprints, indicating that not everything was overcommitted to a single sprint. In a real team setting, tracking this over multiple sprints would help calibrate velocity — i.e., how many story points the team can reliably complete per sprint — and flag if a sprint is consistently under- or over-planned.
